(Received April 28, 1985)

ABSTRACT. The general diophantine equations of the second and third degree are far from being totally solved. The equations considered in this paper are

i) \( x^2 - my^2 = \pm 1 \)

ii) \( x^3 + my^3 + nz^3 = 3 \text{xyz} + 1 \)

iii) Some fifth degree diophantine equations

Infinitely many solutions of each of these equations will be stated explicitly, using the results from the ACF discussed before.

It is known that the solutions of Pell's equation are well exploited. We include it here because we shall use a common method to solve these three above mentioned equations and the method becomes very simple in Pell's equations case.

Some new third and fifth degree combinatorial identities are derived from units in algebraic number fields.

KEY WORDS AND PHRASES. Diophantine equations, identities, an algorithm in a complex field (abbr. ACF), units in the algebraic number fields.

1980 MATHEMATICS SUBJECT CLASSIFICATION CODE. 10B10, 10B37, 10A30, 12A45.

0. INTRODUCTION

In this paper we shall investigate Diophantine equations of the second and third degree of a special type. The general equations of the second and third degrees are far from being totally solved. It suffices to look up Mordell's book on Diophantine equations, to learn how little we actually know about the general second and third degree Diophantine equations, in spite of the many numerous results on this subject that have been gained by great mathematicians with no little effort. The famous Thue theorem stating that the equation

\[ a_0x^n + a_1x^{n-1}y + \cdots + a_{n-1}xy^{n-1} + a_ny^n = c \]

\((a_i, c \text{ rational integers, } i = 0, 1, \ldots, n; \ n > 2)\)
has only a finite number of (rational) solutions is an amazing discovery. It leaves open the question how to find these solutions and what is their exact number, and one would conjecture that it will remain open for (all) times to come.

The equations considered in this part of the paper are:

i) The equation, known (wrongly) as Pell's equation, namely

\[ x^2 - my^2 = \pm 1, \]

ii) The equation \( x^5 + my^5 + m^2 z^5 - 3mxyz = l, \)

iii) and

\[
\begin{vmatrix}
  x & y & z & u & v \\
  nv & x & y & z & u \\
  mu & mv & x & y & z \\
  mz & mu & mv & x \\
  my & mz & mu & mv & x
\end{vmatrix} = l.
\]

Infinitely many solutions of each of these equations will be stated explicitly. Now, it is known that the solutions of Pell's equations is well exploited. Still, we found it necessary to include it here because of the simple method we shall use in solving this equation here, which has such a wide range of application in various branches of exact sciences. Also, we will derive some new combinatorial identities.

Since we are going to use some formulas obtained by the author in some previous papers \([1]\) and \([2]\) we introduce them here

\[
\begin{align*}
A_0^{(0)} &= 1, \\
A_0^{(1)} &= 0, \\
A_0^{(n+2)} &= A_0^{(n)} + 2DA_0^{(n+1)} \\
A_1^{(0)} &= 0, \\
A_1^{(1)} &= 1, \\
A_1^{(n+2)} &= A_1^{(n)} + 2DA_1^{(n+1)} \\
n &= 0, 1, \ldots \\
A_1^{(n+1)} &= A_0^{(n)} + 2DA_1^{(n+1)} = A_1^{(n+2)}, \\
A_0^{(2n)} &= \sum_{i=0}^{n-1} (2n+1)(2n-2i), \\
&= \sum_{i=0}^{n-2} (2n-2i)(2n-2i-1), \\
&= \sum_{i=0}^{n-2} (2n-2i)(2n-2i-1)
\end{align*}
\]

for \( n \geq 2n-1 \).

\[
A_0^{(2n+1)} = \sum_{i=0}^{n-1} (2n-1)(2n-2i), \\
A_0^{(2n+1)} = \sum_{i=0}^{n-1} (2n-2i)(2n-2i-1), \\
A_0^{(2n+1)} = \sum_{i=0}^{n-1} (2n-2i)(2n-2i-1)
\]

and

\[
\begin{align*}
e & = A_0^{(f)} + a_1^{(0)} A_0^{(f+1)} + \cdots + a_{n-1}^{(0)} A_0^{(f+n-1)}, \\
e & = A_0^{(f)} + a_1^{(0)} A_0^{(f+1)} + \cdots + a_{n-1}^{(0)} A_0^{(f+n-1)} \quad \text{for} \ f = 1, 2, \ldots
\end{align*}
\]

\[
\begin{align*}
A_0^{(v)}, & A_0^{(v+1)}, \ldots, A_0^{(v+n-1)} \\
A_1^{(v)}, & A_1^{(v+1)}, \ldots, A_1^{(v+n-1)} \\
&= (-1)^v(v-1)
\end{align*}
\]

\[
\begin{align*}
A_0^{(n)} &= 1, \\
A_0^{(1)} &= A_0^{(2)} = 0, \\
A_0^{(n)} &= A_0^{(n)} + 3DA_0^{(n+1)} + 3DA_0^{(n+2)}
\end{align*}
\]

\[
\begin{align*}
n &= 0, 1, \ldots
\end{align*}
\]
$$A_1^{(n+2)} = A_0^{(n+1)} + 3DA_0^{(n+2)}$$

$$A_2^{(n+2)} = A_0^{(n)} + 3DA_0^{(n+1)} + 3D^2A_0^{(n+2)}$$

$$
\begin{align*}
\sum_{i=1}^{K} a_{n-1}^{(i)} &= A_0^{(k)} + a_1^{(k)}A_0^{(k+1)} + \ldots + a_{n-1}^{(k)}A_0^{(k+n-1)} \\
A_0^{(n+5)} &= \sum_{y_1^2+y_2^2+y_3^2=n} \left( \frac{y_1+y_2+y_3}{y_1+y_2+y_3} \right)^3 y_2^2y_3^2 D y_2^2y_3^2
\end{align*}
$$

$$n = 0, 1, \ldots; \ (0_0) \equiv 1$$

$$A_0^{(0)} = 1, A_0^{(1)} = A_0^{(2)} = A_0^{(3)} = A_0^{(4)} = 0.$$  

$$A_0^{(n+5)} = A_0^{(n)} + 5DA_0^{(n+1)} + 10D^2A_0^{(n+2)} + 10D^3A_0^{(n+3)} + 5D^4A_0^{(n+4)}$$

$$n = 0, 1, \ldots$$

1. **PELL'S EQUATION**

We denote

$$w^2 = D^2 + 1 = m, \ w = \sqrt{D^2 + 1},$$

$$D \in \mathbb{N}, \ m \text{ not a perfect square}.$$ (1.1)

We obtain from (0.6) with \(n = 2\),

$$\begin{vmatrix} A_0^{(n)} & A_0^{(n+1)} \\ A_1^{(n)} & A_1^{(n+1)} \end{vmatrix} = (-1)^{(2-1)n}$$

$$n = 0, 1, \ldots$$ (1.2)

and from (0.1), (0.2)

$$\begin{vmatrix} A_0^{(n)} & A_0^{(n+1)} \\ A_0^{(n+1)} & A_0^{(n+2)} \end{vmatrix} = \begin{vmatrix} A_0^{(n)} & A_0^{(n+1)} \\ A_0^{(n+1)} & A_0^{(n+2)} + 2DA_0^{(n+1)} \end{vmatrix} =$$

$$A_0^{(n)} + 2DA_0^{(n)}A_0^{(n+1)} = A_0^{(n+1)} = (A_0^{(n)} + DA_0^{(n+1)})^2 - (D^2 + 1)A_0^{(n+1)}^2,$$

$$A_0^{(n+1)} = A_0^{(n+1)} = (-1)^n.$$ (1.3)

We have obtained Pell's equations

$$x_n^2 - my_n^2 = (-1)^n, \ n = 0, 1, \ldots$$

$$x_n = A_0^{(n)} + DA_0^{(n+1)}, \ y_n = A_0^{(n+1)}$$

$$x_{2n} = A_0^{(2n)} + DA_0^{(2n+1)}, \ y_{2n} = A_0^{(2n+1)}$$

$$x_{2n}^2 - my_{2n}^2 = 1.$$ (1.4)

$$x_{2n+1} = A_0^{(2n+2)} + DA_0^{(2n+2)}, \ y_{2n+1} = A_0^{(2n+2)}$$

$$x_{2n+1}^2 - my_{2n+1}^2 = -1.$$ (1.5)

$$x_{2n+2}^2 - my_{2n+2}^2 = -1.$$ (1.6)
Thus we have obtained infinitely many solutions of \( x^2 - my^2 = \pm 1 \), and, as is known from the theory of continued fractions, these are all solutions of these two equations, the so-called plus and minus cases of Pell’s equations.

With (0.3), (0.4), formulas (1.5), (1.6) take the forms

\[
x_{2n} = \sum_{i=0}^{n-1} \binom{2n-2-i}{2D}^{2n-2-2i} + \binom{2n-1-i}{2D}^{2n-2i},
\]

\[
y_{2n} = \sum_{i=0}^{n-1} \binom{2n-1-i}{2D}^{2n-1-2i},
\]

\[
x_{2n} - my_{2n} = 1, \quad n = 0, 1, \ldots
\]

\[
x_{2n+1} = \sum_{i=0}^{n-1} \binom{2n-1-i}{2D}^{2n-1-2i} + \sum_{i=0}^{n} \binom{2n-1-i}{2D}^{2n+1-2i},
\]

\[
y_{2n+1} = \sum_{i=1}^{n} \binom{2n-i}{2D}^{2n-2i}, \quad n = 0, 1, \ldots
\]

\[
x_{2n+1} - my_{2n+1} = -1.
\]

With the calculations of \( A_0^{(v)} \) from Ch. 0, we have

\[
x_0 = A_0^{(0)} + DA_0^{(1)} = A_0^{(0)} = 1; \quad A_0^{(1)} = y_1 = 0,
\]

\[
x_0^2 = my_0^2 = 1^2 - (D^2 + 1) \cdot 0 = 1.
\]

\[
x_1 = A_0^{(1)} + DA_0^{(2)} = D; \quad y_1 = A_0^{(2)} = 1,
\]

\[
x_1^2 - my_1^2 = D^2 - (D^2 + 1) \cdot 1 = -1.
\]

\[
x_2 = A_0^{(2)} + DA_0^{(3)} = 1 + 2D^2; \quad y_2 = 2D,
\]

\[
x_2^2 - my_2^2 = (1 + 2D^2)^2 + (1 + D^2) \cdot 4D^2 = 1.
\]

\[
x_3 = A_0^{(3)} + DA_0^{(4)} = 3D + 4D^3; \quad y_3 = 1 + 4D^2,
\]

\[
x_3^2 - my_3^2 = (3D + 4D^3)^2 - (1 + D^2)(1 + 4D^2)^2 = -1,
\]

\[
x_4 = 1 + 8D^2 + 8D^4; \quad y_4 = 4D + 8D^3,
\]

\[
x_4^2 - my_4^2 = (1 + 8D^2 + 8D^4)^2 - (1 + D^2)(4D + 8D^3)^2 = 1.
\]

2. UNITS IN \( \mathbb{Q}(w) \), \( w = \sqrt{D^2 + 1} \)

It is clear that

\[
e = w + D
\]

is a unit in \( \mathbb{Q}(w) \). For \( e \) is an integer, and \( e^{-1} = w - D \), an integer.

The ACF \( A_0^{(1)} = w + D \) is purely periodic with length of its primitive period \( \ell = 1 \); hence we have from formula (0.5)

\[
e^n = (w + D)^n = A_0^{(n)} + (w + D)A_0^{(n+1)}.
\]
From (2.2) we get an interesting combinatorial identity
\[(w+D)^{2n} = A_0^{(2n)} + (w+D)A_0^{(2n+1)}\]
\[(w+D)^{2n} = A_0^{(2n)} + DA_0^{(2n+1)} + wA_0^{(2n+1)},\]
hence from (1.5)
\[(w+D)^{2n} = x_{2n} + y_{2n}^m.\]  \hspace{1cm} (2.3)

With \(w^2 = b^2 + 1 = m,\) the reader will easily verify the formulas
\[(w+D)^{2n} = \left( \sum_{i=0}^{n} \binom{2n}{2i}D^{2i}m^{n-i} \right) + \left( \sum_{i=0}^{n-1} \binom{2n}{2i+1}D^{2i+1}m^{n-i-1} \right) w.\]  \hspace{1cm} (2.4)

From (2.3) and (2.4), and using the expressions for \(x_{2n}\) and \(y_{2n}\) from the previous paragraph, we obtain the combinatorial identities
\[
\sum_{i=0}^{n-1} \left[ \binom{2n-2-i}{i}(2D)^{2n-2-2i} \frac{1}{i!} \binom{2n-1-i}{i}(2D)^{2n-2i} \right]
= \sum_{i=0}^{n-1} \binom{2n}{2i}D^{2i}(b^2+1)^{n-i}.\]  \hspace{1cm} (2.5)

\[
\sum_{i=0}^{n-1} \binom{2n-1-i}{i}(2D)^{2n-1-2i} = \sum_{i=0}^{n-1} \binom{2n}{2i+1}D^{2i+1}(b^2+1)^{n-i-1}.\]  \hspace{1cm} (2.6)

Similar identities are obtainable from
\[(w+D)^{2n+1} = x_{2n+1} + y_{2n+1}^m.\]

3. THE CUBIC DIOPHANTINE EQUATIONS

We shall need formulas (0.6), (0.7), (0.8), (0.9) for \(n=3,\) viz.
\[
\begin{array}{ccc}
A_0^{(n+1)} & A_0^{(n+2)} & A_0^{(n+3)} \\
A_1^{(n+1)} & A_1^{(n+2)} & A_1^{(n+3)} \\
A_2^{(n+1)} & A_2^{(n+2)} & A_2^{(n+3)}
\end{array}
= \begin{array}{c}
1
\end{array} \hspace{1cm} (3.1)
\begin{array}{c}
A_0^{(0)} = 1, \quad A_0^{(1)} = A_0^{(2)} = 0, \\
A_0^{(n+3)} = A_0^{(n)} + 3DA_0^{(n+1)} + 3b^2A_0^{(n+2)}, \\
A_1^{(n+3)} = A_0^{(n+2)} + 3DA_0^{(n+3)} \\
A_2^{(n+3)} = A_0^{(n+1)} + 3DA_0^{(n+2)} + 3b^2A_0^{(n+3)}.
\end{array} \hspace{1cm} (3.2)

Substituting in (3.1) the values for \(A_1^{(1)}, A_2^{(1)}, i = n+3\) from (3.2), we obtain, after simple rearrangements
\[
\begin{array}{ccc}
A_0^{(n+1)} & A_0^{(n+2)} & A_0^{(n+3)} \\
A_0^{(n)} + 3DA_0^{(n+1)} & A_0^{(n+1)} + 3DA_0^{(n+2)} & A_0^{(n+2)} + 3DA_0^{(n+3)} \\
A_0^{(n+1)} + 3DA_0^{(n)} + 3b^2A_0^{(n+1)} & A_0^{(n)} + 3DA_0^{(n+1)} + 3b^2A_0^{(n+2)} & A_0^{(n+1)} + 3DA_0^{(n+2)} + 3b^2A_0^{(n+3)}
\end{array}
\]
\[
A_0^{(n+1)} A_0^{(n+2)} A_0^{(n+3)} \\
A_0^{(n+1)} A_0^{(n+2)} \\
A_0^{(n+1)} A_0^{(n+2)} \\
\]

We now denote
\[x = A_0^{(n-1)}, \quad y = A_0^{(n)}, \quad z = A_0^{(n+1)} \quad (3.3)\]

and obtain for the above determinant
\[
\begin{vmatrix}
z + 3Dy + 3D^2z & y + 3Dz + 3D^2A_0^{(n+3)} \\
y & z \\
x & y \\
\end{vmatrix} = 1. \quad (3.4)
\]

Subtracting from the first row the 3D multiple of the third and the
3D^2 of the second, we obtain,
\[
\begin{vmatrix}
2 - 3Dx - 3D^2y & x & y \\
y & z + 3Dy + 3D^2z \\
x & y & z \\
\end{vmatrix} = 1. \quad (3.4)
\]

We leave it to the reader to expand the determinant in (3.4) to obtain
the Diophantine equation of the third degree as
\[
x^3 + (9D^3 + 1)y^3 + z^3 + (9D^3 - 3)xyz + 6Dx^2y + 3D^2x^2z \\
+ 12D^2y^2x + (9D^4 - 3D)y^2z - 3D^2x - 6D^2z^2y = 1. \quad (3.5)
\]

Even for \(D = 1\), equation (3.5) has a complicated form as
\[
x^3 + 10y^3 + z^3 + 6xyz + 6x^2y + 3x^2z + 12y^2x \\
+ 6y^2z - 3z^2x - 6z^2y = 1. \quad (3.6)
\]

In [2] we have calculated the solution triples \(A_0^{(n)}, A_0^{(n+1)}, A_0^{(n+2)}, n = 0, 1, \ldots \)
\[(x, y, z) = (1, 0, 0), (0, 0, 1), (0, 1, 3), (1, 3, 12), \\
(3, 12, 46), (12, 46, 177). \]

We shall check the solution
\[(x_3, y_3, z_3) = (1, 3, 12). \]

Substituting these values in (3.6), we obtain
\[1 + 270 + 1728 + 216 + 18 + 36 + 108 + 648 - 432 - 292 = 1, \quad 3025 - 3024 = 1. \]

For larger values of \(D\) and \(n\) the verification of (3.5) is only possible
by computer, and without knowing (3.3) even a computer would
have its problems.

As we shall soon see, there is a much simpler third degree
Diophantine equation which can be regarded as, and indeed in a certain
case represents, a generalization of Pell's equation to the third
degree.
4. UNITS IN THE CUBIC FIELD

As we have seen in [1], the ACF of the vector \( a(0) \in E_3 \), with \( w = \sqrt{D+1}, D \in \mathbb{N}, a(0) = (w+2D, w^2+Dw+D^2) \), is purely periodic with length of primitive period \( \ell = 1 \). Hence, by theorem 2 in [2] and formula (0.10)

\[
e = w^2 + Dw + D^2
\]

is a unit in \( \mathbb{Q}(w) \), and

\[
e^v = A_0^{(v)} + (w+2D)A_0^{(v+1)} + (w^2+Dw+D^2)A_0^{(v+2)}
\]

\[
\begin{aligned}
&v = 0, 1, \ldots \\
&v = 0, 1, \ldots
\end{aligned}
\]

Thus

\[
(w^2+Dw+D^2)^v = A_0^{(v)} + 2DA_0^{(v+1)} + D^2A_0^{(v+2)}
\]

\[
+ (A_0^{(v+1)} + DA_0^{(v+2)})w + D^2A_0^{(v+2)}w^2
\]

We shall find the field equation of the expressions (1.3) in \( \mathbb{Q}(w) \).

We denote

\[
\begin{aligned}
x_v &= A_0^{(v)} + 2DA_0^{(v+1)} + D^2A_0^{(v+2)} \\
y_v &= A_0^{(v+1)} + DA_0^{(v+2)} \\
z_v &= A_0^{(v+2)}
\end{aligned}
\]

and have

\[
\begin{aligned}
e^v &= x_v + y_vw + z_vw^2 \\
we^v &= mz_v + x_vw + y_vw^2 \\
w^2e^v &= my_v + mz_vw + x_vw^2
\end{aligned}
\]

\[
m = w^3 = D^3+1.
\]

Hence

\[
\begin{vmatrix}
x_v & y_v & z_v \\
mz_v & x_v & y_v \\
m^2y_v & mz_v & x_v
\end{vmatrix} = 1,
\]

since \( N(e) = 1 \), as the reader will easily verify.

Expanding the determinant in (4.6), we obtain

\[
x_v^3 + my_v^3 + mz_v^3 - 3mxy_vz_v = 1
\]

\[
x_v, y_v, z_v \text{ from (4.4), } v = 0, 1, \ldots
\]

The Diophantine equation

\[
x_3^3 + my_3^3 + mz_3^3 - 3mxyz = 1
\]

is indeed Pell's equation generalized to the third dimension. It is
simpler compared with (3.6) and it has as solutions (4.4).

We shall verify formula (4.5), first line for \( v = 1, 2 \). We have, from (4.4),
\[ x_1 = A_0^{(1)} + 2DA_0^{(2)} + D^2A_0^{(3)} = D^2, \]
\[ y_1 = A_0^{(2)} + DA_0^{(3)} = D, \]
\[ z_1 = A_0^{(3)} = 1. \]
\[ (D^2)^3 + (D^3 + 1)D^3 + (D^3 + 1)^2 - 3(D^3 + 1)D^2 \cdot D = \]
\[ D^6 + D^6 + D^6 + 2D^3 + 1 - 3D^6 - 3D^3 = 1; \]
\[ x_2 = A_0^{(3)} + 2DA_0^{(3)} + D^2A_0^{(4)} \]
\[ x_2 = 2D + D^2 \cdot 3D^2 = 2D + 3D^4, \]
\[ y_2 = A_0^{(3)} + DA_0^{(4)} = 1 + 3D^3 \]
\[ z_2 = A_0^{(4)} = 3D^2. \]

We obtain substituting \((x_2, y_2, z_2)\) in (4.7)
\[ 1 + 18D^3 + 99D^6 + 162D^9 + 81D^{12} - 3(6D^3 + 33D^6 + 54D^9 + 27D^{12}) = 1. \]

We shall now extract a few interesting identities from Formula (4.3).
We have, by the binomial theorem,
\[
(w^2 + Dw + D^2)^{3n} = \sum_{i=0}^{3n} (w^2)^{2n-i}(Dw + D^2)^i =
\]
\[ = \sum_{i=0}^{3n} (\binom{3n}{i})w^{6n-2i-1}(Dw)^{1-i}D^2j =
\]
\[ = \sum_{i=0}^{3n} (\binom{3n}{i})w^{6n-2i}(\binom{1}{j})D^{1+i}w^{i}D^{j} =
\]
\[ = \sum_{i=0}^{3n} (\binom{3n}{i})w^{6n-(1+j)}D^{i+j}.
\]

In the sum \(\sum_{i=0}^{3n} (\binom{3n}{i})w^{6n-(1+j)}D^{i+j}, \ i = 0, 1, \ldots, 3n; \ j = 0, 1, \ldots, i; \) we want to find the coefficient of powers of \(w^{3n}\), so that since \(w^3 = w = D^3 + 3\), this sum becomes rational. For this purpose we have to set \(i+j = 0(3)\) and obtain
\[
(w^2 + Dw + D^2)^{3n} = 
\sum_{i+j=0, 3s \leq 6n, j=0,1,\ldots, i, 2n} (\binom{3n}{i})w^{6n-3s}D^{3s}
\]

(4.8) is an appealing formula for the expression \((w^2 + Dw + D^2)^{3n}\), though this expression could also be calculated by the multinomial theorem.

We have, in order to illustrate its application; \(n=1, s=0,1,2.\)
DIOPHANTINE EQUATIONS AND IDENTITIES

\begin{align*}
    s &= 0; i = j = 0; \\
    s &= 1; i = 2, j = 1; i = 3, j = 0; \\
    s &= 2; i = 3, j = 3. (i \leq 3).
\end{align*}

Hence we have for the rational part of \( e^3 \):

\begin{align*}
    (w^2 + Dw + D^2)^3 &= \left( \frac{3}{3} \right)_0 w^3 + \left( \frac{3}{2} \right)_1 w^3 b^2 + \left( \frac{3}{2} \right)_0 w^5 b^3 + \\
    &+ \left( \frac{3}{2} \right)_0 w^6 = w^6 + 7D^3 w^3 + D^6; \\
    [w^2 + (Dw + D^2)^2]^3 &= w^8 + 3D^2 w^2 (Dw + D^2)^2 + (Dw + D^2)^3 = \\
    &= w^6 + 3Dw^2 + 3D^2 w^4 + 3D^2 w^4 + 6D^3 w^3 + \\
    &+ 3D^2 w^4 + D^3 w^3 + 3D^2 w^2 + 3D^2 w + D^6.
\end{align*}

The rational members of this sum are \( w^6 + 6D^2 w^3 + b^3 w^3 + D^6 \), as was calculated above, with \( w^3 = m = D^3 + 1 \). The formula (4.8) is easily applicable since there is no difficulty to solve the linear equations \( i + j = 3s \).

We shall now find the rational part of \( e^6 = (w^2 + Dw + D^2)^6 \). By formula (4.8), with

\begin{align*}
    n &= 2, s = 0, 1, 2, 3, 4; i + j = 3s, j \leq i \leq 6; \\
    s &= 0; i = j = 0; \\
    s &= 1; i = 3, j = 0, \\
    i &= 2, j = 1; \\
    s &= 2; i = 6, j = 0, \\
    i &= 5, j = 1, \\
    i &= 4, j = 2, \\
    i &= 3, j = 3; \\
    s &= 3; i = 6, j = 3, \\
    i &= 5, j = 4; \\
    s &= 4; i = 6, j = 6;
\end{align*}

we obtain

\begin{align*}
    \left( \frac{6}{5} \right)_0 w^{12} + \left( \frac{6}{5} \right)_0 w^{12} + \left( \frac{6}{5} \right)_1 w^9 b^3 + \\
    + \left( \frac{6}{5} \right)_0 w^{12} + \left( \frac{6}{5} \right)_2 w^9 b^3 + \left( \frac{6}{5} \right)_4 w^6 b^6 + \\
    + \left( \frac{6}{5} \right)_0 w^{12} + \left( \frac{6}{5} \right)_2 w^9 b^6 + \left( \frac{6}{5} \right)_6 w^6 b^{12} = \\
    = w^{12} + 50w^9 b^3 + 14w^6 b^6 + 50w^3 b^9 + D^{12} = \\
    = w^{12} + 50w^9 b^3 + 14w^6 b^6 + 50w^3 b^9 + D^{12}, \\
    m &= D^3 + 1 = w^3.
\end{align*}

We thus have the final result, viz. The rational part of \( e^{3n} = (w^2 + Dw + D^2)^{3n} \) equals

\[
    \sum_{i + j = 3s, i \leq j \leq 6} \left( \frac{3n}{3} \right)_i \left( \frac{1}{3} \right)_j m^{2n - s} b^{3s}, \quad m = D^3 + 1.
\]

(4.9)
We shall now find the coefficient of \( w \) in
\[
\sum_{i=0}^{3n} (\binom{3n}{i}) \binom{i}{j} w^{6n-(i+j)} \ p^{i+j}
\]
and demand, to this end,
\[
\begin{align*}
6n - (i+j) & \equiv 1 \pmod{3} , \\
i+j & = 2(3) , \ i+j = 3s+2 \\
s & = 0, 1, \ldots, 2n-1,
\end{align*}
\]
and obtain thus, that this coefficient equals
\[
\sum_{i+j=3s+2}^{i=0} \binom{3n}{j} w^{6n-(3s+2)} \ p^{3s+2}
\]
But
\[
w^{6n-(3s+2)} = w^{6n-(3s+3)+1} = w^{3(2n-(s+1))+1} = w^{2n-(s+1)},
\]
\[
a = w^{3} = D^{3} + 1.
\]
Hence,
\[
\text{The coefficient of } w \text{ in } (w^{2} + D^{2} + D^{2})^{3n} \text{ equals}
\]
\[
\sum_{i+j=3s+2}^{i=0} w^{2n-s-1} \binom{3n}{j} \binom{i}{j}
\]
Illustration of (4.12):
\[
n = 1; \ s = 0, 1; \ s = 0; \ i = 2, j = 0; \ i = 1, j = 1;
\]
\[
s = 1; \ i = 3, j = 2.
\]
The coefficient of \( w \) in the expansion of \((w^{2} + D^{2} + D^{2})^{3}\) equals
\[
D^{2}[(\binom{3}{2})(\binom{0}{2}) + (\binom{3}{1})(\binom{1}{1})] + D^{5}[(\binom{3}{2})(\binom{3}{2})] = 6D^{2} + 3D^{5},
\]
as the reader can verify.
\[
n = 2; \ s = 0, 1, 2, 3; \ 3n = 6 \ \geq \ i.
\]
\[
s = 0; \ i = 2; \ j = 0; \ i = 1, j = 1;
\]
\[
s = 1; \ i = 5, j = 0; \ i = 4, j = 1; \ i = 3, j = 2;
\]
\[
s = 2; \ i = 6, j = 1; \ i = 5, j = 2; \ i = 4, j = 3;
\]
\[
s = 3; \ i = 6, j = 5.
\]
The coefficient of \( w \) in \((w^{2} + D^{2} + D^{2})^{6}\) equals
\[
[(\binom{6}{2})(\binom{3}{0}) + (\binom{6}{1})(\binom{1}{1})]D^{2}m^{3} + [(\binom{6}{2})(\binom{3}{2}) + (\binom{6}{1})(\binom{1}{2})]D^{5}m^{2} + \\
+ [(\binom{6}{2})(\binom{5}{2}) + (\binom{6}{3})(\binom{3}{2}) + (\binom{6}{4})(\binom{4}{2})]D^{8}m + [(\binom{6}{2})(\binom{5}{2})]D^{11} =
\]
\[
= 21D^{2}m^{3} + 12D^{5}m^{2} + 12D^{8}m + 6D^{11}.
\]
The reader will now prove without any difficulty that:
The coefficient of $w^2$ in $(w^2+Dw+D^2)^{3n}$ equals

$$
\sum_{\substack{i+j=3s+1; \\
0 \leq j \leq 3n}} (3n)(i)1^3s+1 \cdot 2n-s-1
$$

But by (4.3) we have

$$(w^2+Dw+D^2)^{3n} = [A_0^{(3n)} + 2DA_0^{(3n+1)} + A_0^{(3n+2)}] +$$

$$+ [A_0^{(3n+1)} + DA_0^{(3n+2)}]w + D^2A_0^{(3n+2)}w^2.$$ 

With (4.9), (4.12), (4.13) we obtain the identities

$$
\sum_{\substack{i+j=3s \leq 6n; \\
0 \leq j \leq 3n}} (3n)(i)1^3s \cdot 2n-s-1 = A_0^{(3n)} + 2DA_0^{(3n+1)} + D^2A_0^{(3n+2)},
$$

(4.14)

$$
\sum_{\substack{i+j=3s+2 \leq 6n-1; \\
0 \leq j \leq 3n}} (3n)(i)1^3s+2 \cdot 2n-s-1 = A_0^{(3n+1)} + DA_0^{(3n+2)},
$$

(4.14a)

$$
\sum_{\substack{i+j=3s+1 \leq 6n-2; \\
0 \leq j \leq 3n}} (3n)(i)1^3s+1 \cdot 2n-s-1 = D^2A_0^{(3n+2)},
$$

(4.14b)

If we substitute in (4.14), (4.14a), (4.14b) the values of $A_0^{(3n)}$, $A_0^{(3n+1)}$, $A_0^{(3n+2)}$, we indeed arrive at some new combinatorial identities. We proceed to obtain further identities for the third dimension.

5. MORE IDENTITIES

We return to formula (4.2)

$$(w^2+Dw+D^2)^{v} = A_0^{(v)} + (w+2D)A_0^{(v+1)} + (w^2+Dw+D^2)A_0^{(v+2)},$$

and have with $(w-D)(w^2+Dw+D^2) = 1,$

$$
(w-D)^v = \frac{1}{A_0^{(v)} + (w+2D)A_0^{(v+1)} + (w^2+Dw+D^2)A_0^{(v+2)}}.
$$

(5.1)

We want to rationalize the denominator in (5.1) so that

$$
[A_0^{(v)} + (w+2D)A_0^{(v+1)} + (w^2+Dw+D^2)A_0^{(v+2)}](a+bw+cw^2) = 1.
$$

(5.2)

We obtain, with $a,b,c$ rationals,

$$
A_0^{(v+1)} + DA_0^{(v+2)}a + A_0^{(v+2)}b + (A_0^{(v+1)} + DA_0^{(v+2)})c = 0,
$$

(5.3)

The determinant of this system of equations (5.3) equals, with
\[ x_v = A_0(v) + 2DA_0^2 + \Delta A_0^2(v+2); \quad y_v = A_0(v+1) + DA_0^2(v+2); \quad z_v = A_0^2(v+2); \]
\[
\begin{bmatrix}
  x_v & mz_v & my_v \\
  y_v & x_v & mz_v \\
  z_v & y_v & x_v
\end{bmatrix} = x_v^3 + my_v^3 + m^2 y_v^3 - 3mx_v y_v z_v = 1.
\]

Hence we obtain from (5.3)
\[
\begin{bmatrix}
  1 & mz_v & my_v \\
  0 & x_v & mz_v \\
  0 & y_v & x_v
\end{bmatrix}
\begin{bmatrix}
  a \\
  b \\
  c
\end{bmatrix}
= x_v^2 - my_v z_v
\]
\[
\begin{bmatrix}
  x_v & 1 & my_v \\
  y_v & 0 & mz_v \\
  z_v & 0 & x_v
\end{bmatrix}
\begin{bmatrix}
  a \\
  b \\
  c
\end{bmatrix}
= mx_v^2 - x_v y_v
\]
\[
\begin{bmatrix}
  x_v & mz_v & 1 \\
  y_v & x_v & 0 \\
  z_v & y_v & 0
\end{bmatrix}
\begin{bmatrix}
  a \\
  b \\
  c
\end{bmatrix}
= y_v^2 - x_v z_v.
\]

Thus we have obtained the identity.
\[(w-D)^v = x_v^2 - my_v z_v + (mx_v^2 - x_v y_v)w + (y_v^2 - x_v z_v)w^2 \quad \text{or}\]
\[(w-D)^3v = x_v^2 - my_v z_v + (mx_v^2 - x_v y_v)w + (y_v^2 - x_v z_v)w^2 + (\sum_{i=0}^{v-1} (-1)^{i+1} \binom{3v}{3i+1} w^{v-1-i} D^{3i+1})w^2. \quad (5.4)\]

Expanding \((3-D)^3v\), we obtain, with \(w^3 = m = (D^3+1)\)
\[(w-D)^3v = \sum_{i=0}^{v} (-1)^i \binom{3v}{3i} w^{v-i} D^{3i} + \]
\[+ \left( \sum_{i=0}^{v-1} (-1)^{i+1} \binom{3v}{3i+2} w^{v-1-i} D^{3i+2} \right) w + \]
\[+ \left( \sum_{i=0}^{v-1} (-1)^{i+1} \binom{3v}{3i+1} w^{v-1-i} D^{3i+1} \right) w^2. \quad (5.5)\]

With (5.4), (5.5) we obtain some new identities
\[
\sum_{i=0}^{v} (-1)^i \binom{3v}{3i} w^{v-i} D^{3i} = x_v^2 - my_v z_v
\]
\[
\sum_{i=0}^{v-1} (-1)^i \binom{3v}{3i+2} w^{v-1-i} D^{3i+2} = mx_v^2 - x_v y_v
\]
\[
\sum_{i=0}^{v-1} (-1)^{i+1} \binom{3v}{3i+1} w^{v-1-i} D^{3i+1} = y_v^2 - x_v z_v \quad (5.6)
\]
\[v = 0, 1, \ldots; \quad x_v, y_v, z_v \quad \text{from} \quad (4.4).\]
Substituting for \(x_v, y_v, z_v\) the values from (4.4), and the values of \(A^{(v)}\) from (0.11) the identities (5.6) take the form

6. FIFTH DEGREE DIOPHANTINE EQUATIONS

We return to formula (0.6) with \(n = 5\), and obtain

\[
\begin{pmatrix}
A_0^{(n+4)} & A_0^{(n+5)} & A_0^{(n+6)} & A_0^{(n+7)} & A_0^{(n+8)} \\
A_1^{(n+4)} & A_1^{(n+5)} & A_1^{(n+6)} & A_1^{(n+7)} & A_1^{(n+8)} \\
A_2^{(n+4)} & A_2^{(n+5)} & A_2^{(n+6)} & A_2^{(n+7)} & A_2^{(n+8)} \\
A_3^{(n+4)} & A_3^{(n+5)} & A_3^{(n+6)} & A_3^{(n+7)} & A_3^{(n+8)} \\
A_4^{(n+4)} & A_4^{(n+5)} & A_4^{(n+6)} & A_4^{(n+7)} & A_4^{(n+8)} \\
\end{pmatrix}
= (-1)(5-1)(n+4) = 1, \quad n = 0, 1, \ldots
\]  

(6.1)

Substituting for \(A^{(v)}_j, j = 1, 2, 3, 4; v = n+4, \ldots, n+8\); their representation as forms of \(A_0^{(n+j)}\), \(j = 0, 1, 2, 3, 4\), we obtain the matrix equality.

\[
\begin{pmatrix}
A_0^{(n+4)} & A_0^{(n+5)} & A_0^{(n+6)} & A_0^{(n+7)} & A_0^{(n+8)} \\
A_0^{(n+3)} & A_0^{(n+4)} & A_0^{(n+5)} & A_0^{(n+6)} & A_0^{(n+7)} \\
A_0^{(n+2)} & A_0^{(n+3)} & A_0^{(n+4)} & A_0^{(n+5)} & A_0^{(n+6)} \\
A_0^{(n+1)} & A_0^{(n+2)} & A_0^{(n+3)} & A_0^{(n+4)} & A_0^{(n+5)} \\
A_0^{(n)} & A_0^{(n+1)} & A_0^{(n+2)} & A_0^{(n+3)} & A_0^{(n+4)} \\
\end{pmatrix}
= 1.
\]  

(6.2)

We denote

\[
A_0^{(n+4)} = v, \quad A_0^{(n+3)} = u, \quad A_0^{(n+2)} = z, \quad A_0^{(n+1)} = y, \quad A_0^{(n)} = x
\]  

(6.3)

and with formula (0.12), viz.

\[
A_0^{(n+5)} = A_0^{(n)} - 5D_0 A_0^{(n+1)} + 10D_0^2 A_0^{(n+2)} + 10D_0^3 A_0^{(n+3)} + 5D_0^4 A_0^{(n+4)}.
\]

We will also denote

\[
5D = a_4, \quad 10D^2 = a_3, \quad 10D^3 = a_2, \quad 5D^4 = a_1,
\]

\[
(a_4 = b_0(0); \quad a_3 = b_0(0); \quad a_2 = b_0(0), \quad a_1 = b_0(0)).
\]

(6.4)

We then proceed as follows (in order to represent (6.2) as an expression in powers of \(x, y, z, u, v\)):

i) from the first row we subtract the \(a_1\) multiple of the second row, then the \(a_2\) multiple of the third row, then the \(a_3\) multiple of the fourth row, then the \(a_4\) multiple of the fifth row.

ii) from the second row we subtract the \(a_1\) multiple of the third row, then the \(a_2\) multiple of the fourth row, then the \(a_3\) multiple of the fifth row.

iii) from the third row we subtract the \(a_1\) multiple of the fourth row, then the \(a_2\) multiple of the fifth row.

iv) from the fourth row we subtract the \(a_1\) multiple of the fifth row,
and obtain, always applying formula (0.12) and the notations (6.3),
(6.4):
\[
\begin{vmatrix}
  v-a_1u-a_2z-a_3y-a_4x & x & y & z & u \\
  u-a_2z-a_3y & v-a_1u-a_2z-a_3y & x+a_4y & y+a_4z & z+a_4u \\
  z-a_1y-a_2x & u-a_2z-a_3y & v-a_1u-a_2z-a_3y & x+a_4y+a_3z & y+a_4z+a_3u \\
  y-a_1x & z-a_1y & u-a_2z & v-a_1u & x+a_4y+a_2z+a_3u \\
  x & y & z & u & v
\end{vmatrix}
= 1
\] (6.5)

with the values of \(a_1, a_2, a_3, a_4\) from (6.4), \(x, y, z, u, v\) from (6.3) where \(n = 0, 1, \ldots\). The expansion of the determinant (6.5) would yield the expression. Even with \(D = 1\), it will still be very complicated.

For \(n = 0, x = 1, y = z = u = v = 0\), the determinant in (6.5) becomes
\[
\begin{vmatrix}
  -a_4 & 1 & 0 & 0 & 0 \\
  -a_3 & 0 & 1 & 0 & 0 \\
  -a_2 & 0 & 0 & 1 & 0 \\
  -a_1 & 0 & 0 & 0 & 1 \\
  1 & 0 & 0 & 0 & 0
\end{vmatrix}
= 1
\]

and for \(n = 1, u = z = y = x = 0, v = 1\), the determinant becomes
\[
\begin{vmatrix}
  1 & 0 & 0 & 0 & 0 \\
  0 & 1 & 0 & 0 & 0 \\
  0 & 0 & 1 & 0 & 0 \\
  0 & 0 & 0 & 1 & 0 \\
  0 & 0 & 0 & 0 & 1
\end{vmatrix}
= 1
\]

but these elementary determinants can hardly serve as a verification for formula (6.5). For \(n = 2\) the test is also simple.

Let try for \(n = 3\),
\((a_0(3), a_0(4), a_0(5), a_0(6), a_0(7)) = (0, 0, 1, a_1, a_2 + a_1^2) = (x, y, z, u, v)\):
\[
\begin{vmatrix}
  a_2+a_1^2-a_1^2 & a_2+a_1^2-a_1^2 & 0 & 0 & 1 \\
  a_1-a_1 & a_2+a_1^2-a_1^2 & 0 & a_4 & 1+a_1a_4 \\
  1 & a_1-a_1 & a_2+a_1^2-a_1^2 & a_3 & a_4+a_1a_3 \\
  0 & a_1-a_1 & a_2+a_1^2-a_1^2 & a_3 & a_4+a_1a_3 \\
  0 & 0 & a_1-a_1 & a_2+a_1^2-a_1^2 & a_3+a_1a_2
\end{vmatrix}
\]
and subtracting the $a_1$ multiple of the fourth column from the fifth

$$
\begin{align*}
0 & 0 & 0 & 1 & 0 \\
0 & 0 & 0 & a_4 & 1 \\
1 & 0 & 0 & a_3 & a_4 \\
0 & 1 & 0 & a_2 & a_3 \\
0 & 0 & 1 & a_1 & a_2 \\
\end{align*}
$$

7. FIFTH DEGREE IDENTITIES

As we have seen, the ACF of the fixed vector

$$
a^{(0)} = (w+4D, w^2+3Dw^2+6D^2, w^3+2Dw^2+3D^2w+4D^3, w^4+Dw^3+D^2w^2+D^3w+D^4)
$$

is purely periodic with length of the primitive period $t = 1$. Hence we have the formula

$$
e^n = \begin{align*}
&\left( (w^4+Dw^3+D^2w^2+D^3w+D^4)^n = \\
&\quad A_0^{(n)} + (w+4D)A_0^{(n+1)} + (w^2+3Dw^2+6D^2)A_0^{(n+2)} + \\
&\quad (w^3+2Dw^2+3D^2w+4D^3)A_0^{(n+3)} + (w^4+Dw^3+D^2w^2+D^3w+D^4)A_0^{(n+4)},
\end{align*}
\tag{7.1}
$$

$$
n = 0, 1, 2, \ldots, \\
A_0^{(v)} (v = 5, 6, \ldots) \text{ from [1]}
$$

From (7.1) we obtain

$$
\begin{align*}
&\left( (w^4+Dw^3+D^2w^2+D^3w+D^4)^{5n} = \\
&\quad A_0^{(5n)} + 4DA_0^{(5n+1)} + 6D^2A_0^{(5n+2)} + 4D^3A_0^{(5n+3)} + D^4A_0^{(5n+4)} + \\
&\quad (A_0^{(5n+1)} + 3DA_0^{(5n+2)} + 3D^2A_0^{(5n+3)} + 3D^3A_0^{(5n+4)} + \\
&\quad + (A_0^{(5n+2)} + 2DA_0^{(5n+3)} + D^2A_0^{(5n+4)} + \\
&\quad + (A_0^{(5n+3)} + DA_0^{(5n+4)})w + \\
&\quad + (A_0^{(5n+4)} + DA_0^{(5n+4)} + D^2A_0^{(5n+4)} + D^3A_0^{(5n+4)} + D^4A_0^{(5n+4)w})
\end{align*}
\tag{7.2}
$$

We shall now arrange $(w^4+Dw^3+D^2w^2+D^3w+D^4)^{5n}$ in descending powers of $w$. The first step will be to achieve this arrangement in powers of $w^{5n}$,
s = 0, 1, 2, 3, \ldots, 4n, since the highest power of w in that expression is w^{20n}, so we look for the rational part of it. We have by the multinomial theorem
\[
(w^{4} + D w^{3} + D^{2} w^2 + D^{3} w + D^{4})^{5n} = \sum \left( \begin{array}{c}
4y_1 + 3y_2 + 2y_3 + y_4 + y_5 \\
y_1, y_2, y_3, y_4, y_5
\end{array} \right) w^{4y_1 + 3y_2 + 2y_3 + y_4 + y_5} D^{y_2 + 2y_3 + 3y_4 + 4y_5} = k
\]
(7.3)
since the sum of the exponents of w and D in the above expansion equals 20n = k + (20n - k). We also have from (7.3)
\[
4y_1 + 4y_2 + 4y_3 + 4y_4 + 4y_5 = 20n
\]
\[
y_1 + y_2 + y_3 + y_4 + y_5 = 5n.
\]
(7.4)
Since we are looking for 5-multiples of the exponents of w—hence also of D—we obtain from (7.3), (7.4):
The rational part in the expansion of
\[
(w^{4} + D w^{3} + D^{2} w^2 + D^{3} w + D^{4})^{5n} = \sum \left( \begin{array}{c}
5n \\
y_1, y_2, y_3, y_4, y_5
\end{array} \right) \mathcal{m}_D^{20n-5s} \sum_{1=1}^{4} (5-1)y_4 = 5s \leq 20n
\]
(7.5)
s ≥ 0, m = w^5 = (D^5 + 1).
The equation y_2 + 2y_3 + 3y_4 + 4y_5 = 20n - 5s follows from y_1 + y_2 + y_3 + y_4 + y_5 = 5n in the multinomial coefficient.

As an illustration to (7.5) we shall find the rational part in the expansion of \((w^{4} + D w^{3} + D^{2} w^2 + D^{3} w + D^{4})^{5}, n = 1\). We obtain from (7.5) that this equals
\[
\sum \left( \begin{array}{c}
5 \\
y_1, y_2, y_3, y_4, y_5
\end{array} \right) \mathcal{m}_D^{20-5s} \sum_{1=1}^{4} (5-1)y_4 = 5s \leq 20
\]
(7.6)
We solve the equations, s = 0, 1, 2, 3, 4
\[
s = 0; 4y_1 + 3y_2 + 2y_3 + y_4 = 0, y_1 + y_2 + y_3 + y_4 + y_5 = 5
\]
\[
y_1 = y_2 = y_3 = y_4 = 0, y = 5.
\]
The corresponding member in (7.6) equals
\[
\binom{5}{5} \mathcal{m}_D^{20-0} = D^{20}.
\]
DOPHANTINE EQUATIONS AND IDENTITIES

$s = 1; 4y_1 + 3y_2 + 2y_3 + y_4 = 5; y_1 + y_2 + y_3 + y_4 + y_5 = 5$

$y_1 = y_4 = 1; y_2 = y_3 = 0; y_5 = 3.$

$y_1 = 0; y_2 = y_3 = 1; y_4 = 0; y_5 = 3$

$y_1 = 0; y_2 = 1; y_3 = 0; y_4 = 2; y_5 = 2$

$y_1 = y_2 = 0; y_3 = 1; y_4 = 3; y_5 = 1$

$y_1 = y_2 = 0; y_3 = 2; y_4 = 1; y_5 = 2$

$y_1 = y_2 = y_3 = y_5 = 0; y_4 = 5.$

The corresponding member in (7.6) equals

$$\left[\left(\begin{array}{c}1,1,0,0,3 \\ 1,5,0,0,3 \\ 0,1,0,0,2 \\ 0,0,1,3,1 \\ 0,0,2,1,2 \\ 0,0,0,0,5 \end{array}\right) + \left(\begin{array}{c}1,5,0,0,3 \\ 0,1,0,0,2 \\ 0,0,1,3,1 \\ 0,0,2,1,2 \\ 0,0,0,0,5 \end{array}\right)^2\right] m^{-15} = 121 m^{-15}.$$

$s = 2; 4y_1 + 3y_2 + 2y_3 + y_4 = 10; y_1 + y_2 + y_3 + y_4 + y_5 = 5.$

We shall write $(y_1, y_2, y_3, y_4, y_5)$ for the solution of the above linear equations.

$$(2,0,1,0,2); (2,0,2,0,1); (1,2,0,0,2);$$

$$(1,1,3,1,0); (0,2,1,2,0); (0,1,3,1,0);$$

$$(0,0,2,0,0); (1,0,3,0,1); (1,0,2,2,0).$$

The corresponding member in (7.6) equals

$$\left[\left(\begin{array}{c}2,0,5,0,2 \\ 2,0,5,0,2 \end{array}\right) + \left(\begin{array}{c}2,0,5,0,2 \\ 2,0,5,0,2 \end{array}\right) + \left(\begin{array}{c}1,2,0,0,2 \\ 1,2,0,0,2 \end{array}\right) + \left(\begin{array}{c}1,1,5,1,1 \\ 1,1,5,1,1 \end{array}\right) + \left(\begin{array}{c}0,3,0,1,1 \\ 0,3,0,1,1 \end{array}\right) + \left(\begin{array}{c}0,2,0,1,1 \\ 0,2,0,1,1 \end{array}\right) + \left(\begin{array}{c}0,1,3,1,0 \\ 0,1,3,1,0 \end{array}\right) + \left(\begin{array}{c}0,2,1,2,0 \\ 0,2,1,2,0 \end{array}\right) + \left(\begin{array}{c}0,1,3,1,0 \\ 0,1,3,1,0 \end{array}\right) + \left(\begin{array}{c}0,0,5,0,0 \\ 0,0,5,0,0 \end{array}\right) + \left(\begin{array}{c}1,0,3,0,1 \\ 1,0,3,0,1 \end{array}\right) + \left(\begin{array}{c}1,0,2,2,0 \\ 1,0,2,2,0 \end{array}\right) \right]$$

$$= (30 + 30 + 30 + 120 + 20 + 30 + 20 + 30 + 20 + 20 + 1 + 20 + 30) m^{-10} = 381 m^{-10}.$$

$s = 3; 4y_1 + 3y_2 + 2y_3 + y_4 = 15; y_1 + y_2 + y_3 + y_4 + y_5 = 5.$

$$(3,1,0,0,1); (2,2,0,1,0); (3,0,1,1,0);$$

$$(2,1,2,0,0); (1,3,1,0,0); (0,5,0,0,0).$$

The corresponding members in (7.6) equals

$$\left[\left(\begin{array}{c}3,1,5,0,0,1 \\ 3,5,0,0,0,1 \end{array}\right) + \left(\begin{array}{c}2,2,5,0,1,0 \\ 2,2,5,0,1,0 \end{array}\right) + \left(\begin{array}{c}3,0,5,1,1,0 \\ 3,0,5,1,1,0 \end{array}\right) + \left(\begin{array}{c}2,1,5,2,0,0 \\ 2,1,5,2,0,0 \end{array}\right) + \left(\begin{array}{c}1,3,5,1,0,0 \\ 1,3,5,1,0,0 \end{array}\right) + \left(\begin{array}{c}0,5,5,0,0,0 \\ 0,5,5,0,0,0 \end{array}\right) \right] m^{-5} =$$

$$= (20 + 30 + 20 + 30 + 20 + 1) m^{-5} = 121 m^{-5}.$$
\[ s = 4; \quad (4y_1^2 + 3y_2 + 2y_3 + y_4 = 20; \quad (y_1 + y_2 + y_3 + y_4 + y_5 = 5. \]

The only solution is \((5,0,0,0,0)\) and the corresponding member in (7.6) equals
\[
\left( \begin{array}{c}
5 \\
5,0,0,0,0
\end{array} \right) \quad m^4 = \frac{\Delta}{w^4}.
\]

Thus the formula (7.5) yields, for \(n = 1\), the sum
\[
m^4 + 121m^3D^5 + 381m^2D^{10} + 121mD^{15} + D^{20}.
\]

From the other side we have
\[
\left( w^6 + Dw^5 + D^2w^4 + D^3w^4 \right)^5 =
\]
\[
= w^{20} + 5w^{19}D + 15w^{18}D^2 + 35w^{17}D^3 + 70w^{16}D^4 +
\]
\[
+ 121w^{15}D^5 + 189w^{14}D^6 + 255w^{13}D^7 + 320w^{12}D^8 +
\]
\[
+ 355w^{11}D^9 + 381w^{10}D^{10} + 355w^9D^{11} + 320w^8D^{12} +
\]
\[
+ 255w^7D^{13} + 189w^6D^{14} + 121w^5D^{15} + 70w^4D^{16} +
\]
\[
+ 36w^3D^{17} + 10w^2D^{18} + 5wD^{19} + D^{20}.
\]

That the expansion in (7.8) is symmetric (the coefficients of \(w^{20-1}\) and \(w^{20-1}, 1 = 0,1,\ldots,20\), are equal) is clear. The rational part equals
\[
w^{20} + 121w^{15}D^5 + 381w^{10}D^{10} + 121w^5D^{15} + D^{20} =
\]
\[
m^4 + 121m^3D^5 + 381m^2D^{10} + 121mD^{15} + D^{20}
\]

as should be by (7.7).

Comparing formulas (7.2) with (7.5), we obtain the identity
\[
\sum_{i=0}^{4} \left( \begin{array}{c}
5 \\
5-i
\end{array} \right) y_1^{5-i}y_2^i = \sum_{i=0}^{4} \left( \begin{array}{c}
4 \\
4-i
\end{array} \right) A_0^{(5n-i)}.
\]

(7.9)

Substitution of the values of \(A_0^{(v)}\) from (7.6), \(v = 5,6,\ldots\)

From (7.9) would yield a new expression for (7.9). The reader can prove the statements:

The coefficients of \(w\) in the expansion of
\[
(w^4 + Dw^3 + D^2w^2 + D^3w + D^4)^5
\]
equals
\[
\left( \begin{array}{c}
5 \\
5-s
\end{array} \right) y_1^{5-s}y_2^s = \sum_{s=0}^{4} \left( \begin{array}{c}
4 \\
4-s
\end{array} \right) A_0^{(5s+1)}.
\]

(7.10)

Furthermore, the coefficients of \(w^i\) in the expansion of
\[
(w^4 + Dw^3 + D^2w^2 + D^3w + D^4)^5
\]
equal, with \(i = 0,1,2,3,4,\ldots\)
\[
\sum_{i \leq \frac{s}{2}} \left( y_1, y_2, y_3, y_4, y_5 \right) \equiv_{D^{20n-5s-1}} \sum_{i=0}^{4n-1} (5i) y_i^{5s+1} \leq 20n
\]

Comparing (7.2) with (7.11) we have finally the five identities,

\[
\sum_{i \leq \frac{s}{2}} \left( y_1, y_2, y_3, y_4, y_5 \right) \equiv_{D^{20n-5s-1}} \sum_{j=0}^{5n+1} \binom{5n+1}{j} D^j A_0^{(5n+1-j)}
\]

We shall give a verification for formula (7.12) with \( i = 0 \), formula (7.9), \( D = 1 \), \( n = 1 \); we have \( n = D^2 + 2 \), \( A_0^{(0)} = 1 \), \( A_0^{(2)} = A_0^{(3)} = A_0^{(4)} = 0 \), \( A_0^{(n+5)} = A_0^{(n)} + 5A_0^{(n+1)} + 10A_0^{(n+2)} + 10A_0^{(n+3)} + 5A_0^{(n+4)} \), \( A_0^{(5)} = 1 \), \( A_0^{(6)} = 5 \), \( A_0^{(7)} = 35 \), \( A_0^{(8)} = 235 \), \( A_0^{(9)} = 1580 \).

This yields

\[16 + 121 	imes 5 + 381 	imes 4 + 121 	imes 2 + 1 = 1 + 20 + 210 + 940 + 1580 = 2751.\]

It is also easy to verify the identities (7.12) for \( n = 2 \).

8. MORE ABOUT UNITS AND IDENTITIES

Since \( w^5 - D^5 = (w-D)(w^4 + D w^3 + D^2 w^2 + D^3 w + D^4) = 1 \), we have also,

\[e^{-v} = (w-D)^v = \frac{1}{(w^4 + D w^3 + D^2 w^2 + D^3 w + D^4)^4},\]

and with formula (7.2), and setting \( v = 5n \),
\[(w-D)^5n = \frac{1}{a_5 + a_4 w + a_3 w^2 + a_2 w^3 + a_1 w^4} \]

\[a_{5-i} = \sum_{j=0}^{4-i} (4-i) D_j^5 \zeta_{5n+i+j}, \quad i=0, \ldots, 4 \text{ (from (7.12)).} \]  

(8.1)

We shall now rationalize the denominator in (8.1) and demand

\[1 = (a_2 + a_4 w + a_3 w^2 + a_2 w^3 + a_1 w^4)(c_1 + c_2 w + c_3 w^2 + c_4 w^3 + c_5 w^4). \]  

(8.2)

Expanding (8.2), with \(m = w^5 \equiv D^5 + 1\), we obtain

\[
\begin{align*}
  a_5 c_1 + ma_1 c_2 + ma_2 c_3 + ma_3 c_4 + ma_4 c_5 &= 1 \\
  a_4 c_1 + a_2 c_2 + ma_1 c_3 + ma_2 c_4 + ma_3 c_5 &= 0 \\
  a_3 c_1 + a_4 c_2 + a_5 c_3 + ma_1 c_4 + ma_2 c_5 &= 0 \\
  a_2 c_1 + a_5 c_2 + a_3 c_3 + a_4 c_4 + ma_1 c_5 &= 0 \\
  a_1 c_1 + a_2 c_2 + a_3 c_3 + a_4 c_4 + a_5 c_5 &= 0.
\end{align*}
\]  

(8.3)

The determinant of the system of linear equations (8.3) equals, interchanging columns with rows,

\[
\Delta = \begin{vmatrix}
  a_5 & a_4 & a_3 & a_2 & a_1 \\
  ma_1 & a_5 & a_4 & a_3 & a_2 \\
  ma_2 & ma_1 & a_5 & a_4 & a_3 \\
  ma_3 & ma_2 & ma_1 & a_5 & a_4 \\
  ma_4 & ma_3 & ma_2 & ma_1 & a_5
\end{vmatrix}
\]  

(8.4)

Now, the reader will verify that the field equation of

\[e^5n = a_5 + a_4 w + a_3 w^2 + a_2 w^3 + a_1 w^4 \]  

has exactly the free element \(=1\), since \(e\) is a unit, as in case \(n = 3\). We thus obtain

\[(w-D)^5n = c_1 + c_2 w + c_3 w^2 + c_4 w^3 + c_5 w^4. \]  

(8.5)

Expanding \((w-D)^5n\) we obtain the result. The rational part in the expansion of (8.5) equals

\[
\sum_{i=0}^{n} (-1)^i D_i w^{5n-5i}.
\]  

(8.6)

Comparing (8.6) with \(c_1\) and calculating \(c_1\) from (8.3), (8.4), we obtain the identity, with \(w^5 = m = D^5 + 1\).
\[
\sum_{i=0}^{n} (-1)^i D^{5i} m_{i+1} = \begin{vmatrix}
  a_5 & a_4 & a_3 & a_2 \\
  m_{a_1} & a_5 & a_4 & a_3 \\
  m_{a_2} & m_{a_1} & a_5 & a_4 \\
  m_{a_2} & m_{a_2} & m_{a_1} & a_4
\end{vmatrix}.
\]

We substitute the values of \( a_i, i = 1, \ldots, 5 \); from (8.1) and obtain

\[
\sum_{i=0}^{n} (-1)^i D^{5i} m_{i+1} =
\]

\[
\sum_{j=0}^{4} \begin{pmatrix} \sum_{j=0}^{3} (j) D^{3} A^j_0 (5n+1+j) \\ \sum_{j=0}^{2} (j) D^{2} A^j_0 (5n+2+j) \\ \sum_{j=0}^{1} (j) D^{1} A^j_0 (5n+3+j) \\ \sum_{j=0}^{1} (j) D^{2} A^j_0 (5n+4) \\
\end{pmatrix}.
\]

Comparing the powers of \( w^i \) \((i = 1, 2, 3, 4)\) on both sides of (8.5) we obtain four more identities with \( c_i \) \((i = 2, 3, 4, 5)\) calculated from the system (8.3). To have a complete view of (8.8) the values of \( A^0_0 (5n+1) \), \((i = 0, 1, 2, 3, 4)\) \(A^i_0 (5n+1)\), \((i = 0, 1, 2, 3, 4)\) will have to be substituted from (7.6). This would yield very complicated expressions.

Let us only limit at the difficulties of writing out in full — but not calculating — the determinant (8.8) in a simple case, \( D = n = 1 \). We have for the left side of (8.8)
The determinant (8.8) becomes, with the values from (8.1), viz.

\[
\begin{align*}
    a_5 &= \sum_{j=0}^{4} \binom{4}{j} A_0^{(5+j)} = 1 + 4 \cdot 5 + 6 \cdot 35 + 4 \cdot 235 + 1580 = 2751, \\
    a_4 &= \sum_{j=0}^{3} \binom{3}{j} A_0^{(6+j)} = 5 + 3 \cdot 35 + 3 \cdot 235 + 1580 = 2395, \\
    a_3 &= \sum_{j=0}^{2} \binom{2}{j} A_0^{(7+j)} = 35 + 2 \cdot 235 + 1580 = 2085, \\
    a_2 &= \sum_{j=0}^{1} \binom{1}{j} A_0^{(8+j)} = 235 + 1580 = 1815, \\
    a_1 &= \sum_{j=0}^{0} \binom{0}{j} A_0^{(9+j)} = 1580, \quad m = 2.
\end{align*}
\]

Thus formula (8.8) has been verified for $D = n = 1$. The entries in the right hand determinant become a challenge for $n, D > 1$.

On the combined subject of this paper about "Diophantine Equations, Units and Identities" there is not much literature, but I cannot finish without naming the literature in each of the three above mentioned subjects without indicating at the very end, some papers which have been most useful in my paper.
